

Video Head Impulse Test

The vestibular Ocular reflex (VOR) normally serves to stabilize gaze in space during head movement by generating equal and opposite compensatory eye movement.

Since the company's inception, DIFRA has specialized in measuring VOR through such gold standard tests as caloric, rotational chair and active head rotation testing.

The newest tool in the DIFRA VOR tool chest is Video Head Impulse Testing

The Head Impulse Test (HIT) has been used for years to identify vestibular deficit using unpredictable examiner applied, rapid horizontal head movements while observing compensatory catch up saccades indicative of a vestibular loss in the stimulated semicircular canal.

Today, DIFRA has developed a high speed camera (250-500Hz) with built-in 3D gyroscope and 3D accelerometer making much easier to measure VOR gain and record corrective saccades. Camera can be moved on the right or left eye and the software identifies automatically which eye is recorded. Very light and comfortable, our HeadStar has no sleepage problems, so we have no limitation for the maximum speed of the impulse compared to some competitors.

The HeadStar can also be used as a regular monocular VNG system optionally due to the resolution of the camera (640x480 pixels).

With the built-in 3D gyroscope, there is no need to change any part of the device between horizontal testing and anterior/posterior testing.

An automatic detection of good head impulse is implemented in the software to help the user during testing.

Video recording is also possible with a slow motion replay for each impulse.

Assess all six Semicircular Canals

Head Impulse test is the only test available to assess all six semicircular canals (lateral, anterior and posterior).

2D/3D analysis and normative data

View analysis in 2D or 3D. Both display a gain graph with built-in published normative data. A clear 3D picture facilitates easy identification of saccades.

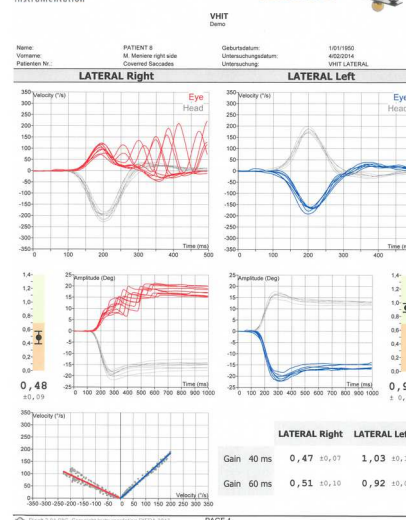

Comparison of test sessions allows for validation of vestibular rehabilitation success.

Due to the sophisticated cameras smaller velocity head impulses of only 15 to 20 degrees are used, making the test more pleasant for the patient.

Video Head Impulse Test

Ref.	Description
DI 140503	Headstar (hardware only)
DI 14050X-VHIT	VHIT Test module, 6 channels
DI 14050X-VHIT-L	VHIT Test module, horizontal channels
DI 14050X-BASIC	VNG Tests module

Both overt and covert saccades can be detected allowing for proper diagnosis and rehabilitation recommendations.

Technical specification

- Weight:
 - * Goggle: 60gr
 - * Camera with 4.5 m USB cable: 70gr
- Camera resolution: 640x480 pixels at 50Hz and 320x240 pixels at 250 Hz.
- Connection to computer: USB 2.0
- Software: DiSoft II compatible with Windows 7 or 8 (32 or 64 bits)
